SPOTLIGHT ON OU

How are OU Advanced Placement Students Doing?

August 2017

Overview and Summary

There are several ways students can obtain college credit during high school. One of the more popular pathways that allow students to do this is for them to take an Advanced Placement (AP) course. At the end of these courses students can take an AP exam and their exam score can be used by colleges to grant them either college credit or exemptions from college courses.

However, a formal investigation regarding student performance and AP scores has not been conducted in several years. Do AP students have better outcomes than non-AP students? If so, what's the difference? This report briefly answers some of these questions by comparing student outcomes between students that enter OU with AP scores and students who had no such scores.

In general, this report finds that students who come to OU with AP scores have higher ACT scores, higher high school G.P.A. and higher first-term G.P.A.s than their non-AP counterparts. Furthermore, AP students seem to do just as well or better than non-AP students in sequential courses such as Math 155 Writing 160, Chemistry 145, and Biology 113.

Sample

The sample consisted of every FTIAC student from fall 2015 that attended OU. These students are broken down into three distinct categories: students that do not have any AP test scores, students that have AP test scores but did not receive OU credit or course exemptions, and students that have AP test scores and received OU credit or an OU course exemption. This document refers to these groups as the 'No AP', 'AP, No Credit', and the 'AP, Credit' groups, respectively.

The sample consists of approximately 2,700 students. About 1,000 of these students have recorded AP test scores, with slightly over 530 students receiving some type of OU credit or course exemption. It should be noted that there are a number of students who enroll in AP courses but opt not to take the AP exam. Additionally, not every student who takes the exam sends their score to OU.

Data

Differences in ACT Scores and High School G.P.A.'s

Students who have AP test scores have higher High School (H.S.) G.P.A.s and ACT scores than students who come to OU not having taken an AP course. Table 1 illustrates the differences in ACT-composite scores and H.S. G.P.A. for each of the three groups. Notice that H.S. G.P.A.s and ACT scores are higher for both groups of AP students, even for the group that had AP scores, but did not receive any OU credit or course exemptions. Both AP groups are significantly different than the 'No AP' group for both H.S. G.P.A. and ACT scores.

Table 1: High School G.P.A. and ACT-Composite Scores by AP Category

| Measure | No AP | AP, No Credit | AP, Credit |
|-------------|-------------|---------------|------------|
| H.S. G.P.A. | 3.26 | 3.62 | 3.84 |
| ACT Score | 21.95 | 25.30 | 28.58 |
| N | 2246 | 807 | 532 |

Differences in First Term and First Year G.P.A.

Students who have AP test scores have higher G.P.A.s than students who do not have AP test scores. Table 2 illustrates the differences in both first term and first year G.P.A.s by student category. Notice the substantial increase in the G.P.A.s between the 'No AP' group and the 'AP, No Credit' group. This difference is even greater between the 'No AP' group and the 'AP, Credit group'. Each AP group has statistically significant differences relative to the 'No AP' group, for both first term G.P.A. and first year G.P.A.

Table 2: First Term and First Year OU Grades by AP Category

| Measure | No AP | AP, No Credit | AP, Credit |
|-------------------------|-------------|---------------|------------|
| First Term G.P.A. at OU | 2.75 | 3.31 | 3.63 |
| First Year G.P.A. at OU | 2.82 | 3.28 | 3.56 |
| N | 2246 | 807 | 532 |

Analyzing AP Student Performance in Sequential Courses

In courses that define a sequence, such as WRT 150 and 160, MTH 154 and 155, BIO 111 and BIO 113, or CHM 144 and 145, it is possible for students to place into the upper level course by receiving credit or an

exemption due to a high AP test score. This makes it possible to analyze the performance of these students and compare them to students who take the entire sequence. There are several such sequences at OU, but only the calculus sequence (MTH 154 and 155), the first-year writing sequence (WRT 150 and 160), the introductory Biology sequence (BIO 111 and 113), and the introductory Chemistry sequence (CHM 144 and 145) have a high enough sample size to warrant further analysis.

Table 3 lists G.P.A.s and pass rates for Math 155 and Writing 160 for two groups of students: AP students that had been exempted from the previous course, and students who started in and completed the lower-level course before taking the upper-level course. In each case, grades were computed by using the first time each student received a grade in the respective course.

Table 3: Writing 160 and Math 155 Outcomes for AP-Students and Comparison Groups

| | Math 155 | Math 155 | Writing 160 | Writing 160 |
|------------------------------|------------|-------------|-------------|-------------|
| Measure | Comparison | AP-Students | Comparison | AP-Students |
| G.P.A. (excludes Ws) | 2.64 | 3.07 | 3.17 | 3.60 |
| Pass Rate (2.0 or better) | 83.1% | 89.8% | 91.9% | 99.1% |
| N | 65 | 88 | 1377 | 112 |

AP-Math students have a higher G.P.A. and a higher pass rate than non-AP math students. AP-Writing students also show the same pattern, with the difference between G.P.A.s. It is worth noting that pass rates for WRT 160 are nearly identical between the two groups, but, despite this, there is still a noticeable difference in G.P.A.s.

Table 4 lists G.P.A.s and pass rates for Biology 113 and Chemistry 145 for the two groups of students: AP students that had been exempted from the previous course, and students who started at the beginning of the sequence. These grades were computed with the first time each student took the course.

Table 4: Biology 113 and Chemistry 145 Outcomes for AP-Students and Comparison Groups

| | Biology 113 | Biology 113 | Chemistry 145 | Chemistry 145 |
|------------------------------|-------------|-------------|---------------|---------------|
| Measure | Comparison | AP-Students | Comparison | AP-Students |
| G.P.A. (excludes Ws) | 2.80 | 3.27 | 2.71 | 3.48 |
| Pass Rate (2.0 or better) | 85.9% | 97.4% | 78.6% | 92.5% |
| N | 85 | 38 | 56 | 40 |

AP- Bio students have a significantly higher G.P.A. and a higher pass rate than those that are not AP students. AP-Chemistry students show the same pattern, with a higher pass rate of 13.9%, than the Comparison group of students.

Conclusion

On every measure, AP students are outperforming their non-AP counterparts. Based on the averages, AP students have higher incoming H.S. G.P.A. and ACT scores than non-AP students, even for students who have AP scores but receive no OU credit or course exemptions. It appears that these differences follow these students, at least through their first academic year, as AP students have higher first term and first year G.P.A.'s relative to non-AP counterparts, with examples from the Writing, Calculus, Chemistry, and Biology sequences.
